NiContains: amino end of core protein p30; core protein p12; core protein p15; protein-t
C,Species: feline sarcoma virus
A,Note: host Felis sp. (cat)
C,Dates: 04-Dec-1986 #sequence_revision 12-May-1994 #text_change 09-Jul-2004
C,Accession: A03936; A00655
R,Besmer, P.; Murphy, J.E.; George, P.C.; Qiu, F.; Bergold, P.J.; Lederman, L.; Snyder J
Nature 320, 415-421, 1986
A,Fitle: A new acute transforming feline retrovirus and relationship of its oncogene v-k
A,Reference number: A00655; MUID:86175044; PMID:3007997
Superfamily: Tyrosine-protein kinase, proto-oncogene SRC type; protein kinase homology 
Keywords: ATP; autophosphorylation; blocked amino end; lipoprotein; myristylation; phd

Thesis (2001), University of Marseille, France.

-!- FUNCTION: May serve as part of a signaling pathway coupling the FC receptor to the activation of the respiratory burst. May also contribute to neutrophil and may regulate the degranulation process of neutrophils (By similarity).

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

-!- FUNCTION: Tyrosine kinase that plays an essential role for the selection and maturation of developing T-cell in the thymus and in mature T-cell function. Is constitutively associated with the cytoplasmic portions of the CD4 and CD8 surface receptors and plays a key role in T-cell antigen receptor (TCR)-linked signal transduction pathways (B9 similarity).

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDLINE=92186854; PubMed=1545804;
Chow L., Ratcliffe M., Veillette A.;
"tkl is the avian homolog of the mammalian lck tyrosine protein kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PTM: Phosphorylated on Tyr-503. This phosphorylation downregulates catalytic activity. Phosphorylated on Tyr-392 either by itself or another kinase, leading to increased enzymatic activity. SIMILARITY: Belongs to the Tyr protein kinase family. SRC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

Perez-Cuintero D.A., Vernot J.P.;
Submitted (FEB-2005) to the EMBL/GenBank/DDBJ databases.

1. PUNCTION: Tyrosine kinase that plays an essential role for the selection and maturation of developing T-cell in the thymus and in mature T-cell function. Is constitutively associated with the cytoplasmic portions of the CD4 and CD8 surface receptors and plays a key role in T-cell antigen receptor(TCR)-linked signal transduction pathways. Association of the TCR with a peptide antigen-bound WHC complex facilitates the interaction of CD4 and CD8 with MHC class II and class I molecules, respectively, and thereby recruits the associated LCK to the vicinity of the TCR/CD3 complex. LCK then phosphorylates tyrosines residues within the immunoreceptor tyrosines-based activation motifs (ITAMs) in the cytoplasmic tails of the TCRgamma chains and CD3 subunits,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phosphotyrosine (negative regulation) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aotus nancymaae (Ma's night monkey).

initiating the TCR/CD3 signaling pathway. In addition, contributes to signaling by other receptor molecules. Associates directly with the cytoplasmic tail of CD2, and upon engagement of the CD2 molecule, LCK undergoes hyperphosphorylation and activation. Also plays a role in the IL2 receptor-linked signaling pathway that controls T-cell proliferative response. Binding of IL2 to its steeptor results in increased activity of LCK. Is expressed at all stages of thymocyte development and is required for the regulation of maturation events that are governed by both pre-TCR and mature alpha beta TCR (By similarity).

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                  tyrosine phosphate.

SUBUNIT: Binds to the cytoplasmic domain of cell surface subunits. Binds to the cytoplasmic domain of cell surface betoes, such as CD2, CD4, CD5, CD8, CD4, CD45, CD4, CD12. Also binds to effector molecules, such as PI4K, VAVI, RASAI, FYB and to other proteins kinases including CDC2, RAFI, ZAP70 and SYK. Binds to phosphatidylinositol 3 - kinase (PI3K) from T lymphocytes through its SH3 domain and to the tyrosine phosphorylated form of KHDRBSI(p70 through its SH2 domain. Interacts with SQSTMI. Interacts with CBLB (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Proto-oncogene tyrosine-protein kinase
                                                                                                                                                                                                                                                                                                                                                                  similarity).
SUBCELLULAR LOCATION: Cytoplasmic and attached to the membrane.
Present in lipid rafts in an unactive form (By similarity).
DOMAIN: The SH2 domain mediates interaction with SQSTM1.
Interaction is regulated by Ser-58 phosphorylation (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ATP-binding; Kinase; Lipoprotein; Membrane; Myristate;
Nucleotide-binding; Palmitate; Phosphorylation; Proto-oncogene;
SH2 domain; 813 domain; Transferase; Tyrosine-protein kinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 preliminary data. We will be control of the eukaryotic cell subcritor. Plays a key role in the control of the eukaryotic cell cycle. It is required in higher cells for entry into S-phase and mitosis. Component of the kinase complex that phosphorylates the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        repetitive C-terminus of RNA polymerase II. Catalytic component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19-JUL-2005, integrated into UniProtKB/TrEMBL.
19-JUL-2005, sequence version 1.
07-FBE-2006, entry version 6.
Chromosome 14 SCAF15003, whole genome shotgun sequence. (Fragment).
ORFNAmes=GSTENG00030294001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tetraodon nigroviridis (Green puffer).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nat. Biotechnol. 23:94-101(2005).

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein tyrosine phosphate.

-tyrosine phosphate.

-!- SUBUNIT: Interacts with phosphorylated LIME1 upon BCR activation. Interacts with Epstein-Barr virus LMP2A.

-!- INTERACTION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isold=P07948-2; Sequence=VSP 005002; TISSUE SPECIFICITY: Expressed in primary neuroblastoma tumors. SIMILARITY: Belongs to the Tyr protein kinase family. SRC

```
The invention relates to a method for the detection of antigen specific recells in a blood sample involving the use of a plurality of antigenic peptides. The method comprises sampling of peripheral blood monocytes; stimulation of the collected peripheral blood monocytes with antigens without direct use of antigen presenting cells; and detection of T-cells specific to the antigen in the stimulated monocytes. The method is particularly used for the detection of cancer as it can be used in semi-apparticularly used for the detection of cancer specific T-cells. It can also be used for cancer vaccine therapy for patients with cervical or prostate cancer. The method can additionally be used to monitor of callular immunity and cancer immune therapy by detection of specific T-cell frequencies. Sequences ABR84165 represent HLA-A2 (human leukocyte antigen) peptides of human origin used in an example from the
                                                                                                                                                                                                 A detection method of antigen specific T-cells, comprises the use of plural antigenic peptides, useful in semi-quantitative determination of cancer specific T-cell frequencies and for monitoring cellular immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  vaccine; ubiquitin; Ub; T-cell target; melanoma; sarcoma; Hodgkins; Imphoma; non-Hodgkins; leukaemia; neuroblaastoma; myeloma; lung cancer; stomach; skin; thyroid; ovary; prostate; womb; pancreas; colon; bladder; breast; oseophagus; kidney; brain; human; epitope; Lck.

The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antigen specific T-cell; detection; diagnosis; cancer specific T-cell; cancer; tumour; cervical cancer; prostate cancer; cellular immunity; immune therapy; cytostatic; immunostimulant; vaccine; antigenic peptide;

The invention relates to a novel genetic vaccine containing the ubiquitin gene together with a gene encoding an antigenic protein containing a T-cell target sequence. The vaccine of the invention may be useful for prevention and treatment of cancers including melanoma, sarcoma, lymphoma (Hodgkins or non-Hodgkins), leukaemia, neuroblastoma, myeloma and cancer of the lung, stomach, skin, thyroid, ovary, prostate, womb, pancreas, colon, bladder, breast, oceophagus, kidney or brain. The current sequence is that of a human genetic vaccine/ubiquitin (Ub)-related epitope peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                src-family tyrosine kinase; serine phosphorylation-mediated degradation;
mutation; T cell activation; immune response; screening; cancerous cell;
therapy; immunity; allogenic transplant; xenogeneic organ transplant.
                                                      Gene vaccine containing cancer antigen genes ligated to ubiquitin genes or cytokine genes for prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide fragment from kinase domain of src-family tyrosine kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "can be replaced with Ala"

immune response. They can also be used for screening candidate the repense. They can also be used for screening candidate stimulating or blocking the antigen-specific immune response. Identification and development of such compounds and protocols is useful for enhancing, decreasing or preventing antigen-specific immune responses. Therapies which enhance the immune response aid in the development of immunity to antigens derived from pathogens and cancerous cells. Therapies which prevent or decrease the development of an antigenspecific immune response are useful in preventing an immune response to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monoclonal receptors to protein, esp. onco-protein ligands - prepd. using a polypeptide corresp. to a portion of the protein aminoacid sequence.
                         This represents a peptide fragment from the kinase domain of src-family tyrosine kinase polypeptide. The invention provides src-family tyrosine kinase peptide fragments (AAM80586 to AAM80591), which on mutation reduces the serine phosphorylation-mediated degradation of the polypeptide. The mutation could be a mutation of the serine residue incoated at the amino terminus to alamine and/or could be a mutation that results in a leucine leucine to alamine-alamine change in the polypeptide. The invention also provides methods for detecting the level of T cell activation; for detecting a compound that modulates T cell in the contraction of the mutation is the serine compound that modulates the serine cannot be serine that modulates the serine cannot be serine the serine cannot be serine that modulates the serine cannot be serine that modulates the serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine that modulates the serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine cannot be serine can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAW14803-32 represent peptides derived from oncogenes which are bound by the monoclonal receptors of the invention. The monoclonal receptor molecules are immunoglobulins which bind to both (a) a protein ligand and (b) a polypeptide having an amino acid residue sequence containing 7-40 amino acid residues corresponding to a sequence
                                                                                                                                                                                                                                                                                                         activation, and for generating a src-family tyrosine kinase polypeptide that has a reduced level of serine phosphorylation-mediated degradation. The methods can be used for the rapid detection of an antigen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antigens derived from e.g. allogenic or xenogeneic organ transplants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oncogene; monoclonal receptor; antibody; immunoglobulin; ligand; immunogen; epitope; oncoprotein; detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Certain retroviruses are able to cause the formation of solid tumours within a short period of time after infection of the host. Oncogenes, and the oncoproteins they encode, are responsible for the tumorigenic potential of these retroviruses. Retroviral oncogenes are closely related to and are derived from cellular oncogenes, which encode proteins with mitogenic activity such as growth factors. The invention relates to monoclonal anti-oncoprotein antibodies, and the method used to purify them. The method of the invention may be used for obtaining burified oncoprotein ligands from aqueous solutions. It may be used in this way to detect proteins produced in tumour cells to diagnose cancers
of a portion of the protein, the receptor molecule having been raised to an immunogen containing the polypeptide. High yields of monoclonal receptors can be obtained which bind to or immunoreact with known predetermined epitopes of protein molecules such as oncoproteins. The receptors can be used for e.g. detection of oncoprotein ligands or in affinity sorbants for binding and purifying oncoprotein ligands. (Updated on 27-MUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oncoprotein, epitope, oncogene, retroviral; infection, cellular; monoclonal; antibody; MAb; purification, cancer; tumour; growth factor; mitogenic; expression; detection; diagnosis; prognosis; immunoassay; growth; development; neoplasia; foetus; non-invasive, oncoprotein.

Oncogenes, and the oncoproteins they encode, are responsible for the tumorigenic potential of these retroviruses. Retroviral oncogenes are proteins with mitogenic acrivity such as growth factors. The invention relates to monoclonal anti-oncoprotein antibodies, and the method used to purify them. The method of the invention may be used for obtaining purific do nooprotein ligands from aqueous solutions. It may be used in this way to detect proteins produced in tumour cells to diagnose cancers
                                                       ü
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oncoprotein; epitope; oncogene; retroviral; infection; cellular; menoclonal; anchibody; MAb; purification; cancer; tumour; growth factor; mitogenic; expression; detection; diagnosis; prognosis; immunoassay; growth; development; neoplasia; foetus; non-invasive. oncoprotein.
caused by retroviruses. It may also be used for the prognostication of foetal development (and other growth states including neoplasia) using either urine or other body fluid obtained by non invasive methods, the antibodies being used to assay for oncoprotein. As the antibodies bind epitopes of known amino acid sequence, the type of oncoprotein being expressed in the patient may be determined. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences AAY52601-Y52675 represent oncoprotein epitopes used to raise

The determinant domain is vicinal to, but exclusive of, an active site of the oncoprotein. (Updated on 09-JAN-2003 to add missing OS field.)
caused by retroviruses. It may also be used for the prognostication of foctal development (and other growth states including neoplasia) using either urine or other body fluid obtained by non invasive methods, the antibodies being used to assay for oncoprotein. As the antibodies bind expitopes of known amino acid sequence, the type of oncoprotein being expressed in the patient may be determined. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic polypeptide(s) - useful for immunisation against neoplastic growth and in detection of neoplastic disease.

                                                                                                                                                       Monoclonal receptors to protein, esp. onco-protein ligands - prepd. using a polypeptide corresp. to a portion of the protein aminoacid sequence.
                                                                                                                                                                                                                                                                        The sequences given in AAW14803-32 represent peptides derived from oncogenes which are bound by the monoclonal receptors of the invention. The monoclonal receptor molecules are immunoglobulins which bind to both (a) a protein ligand and (b) a polypeptide having an amino acid residue sequence containing 7-40 amino acid residues corresponding to a sequence of a portion of the protein, the receptor molecule having been raised to an immunogen containing the polypeptide. High yields of monoclonal receptors can be obtained which bind to or immunoreact with known predetermined epitopes of protein molecules such as oncoproteins. The receptors can be used for e.g. detection of oncoprotein ligands or in affinity sorbants for binding and purifying oncoprotein ligands. (Updated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oncoprotein; epitope; oncogene; retroviral; infection; cellular; amonoclonal; antibody; Mab; purification; cancer; tumour; growth factor; mitogenic; expression; detection; diagnosis; prognosis; immunoassay; growth; development; néoplasia; foetus; non-invasive. oncoprotein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAY52601-Y52675 represent oncoprotein epitopes used to raise monoclonal antibodies which bind to both the epitopes and the proteins chat comprise them. Certain retroviruses are able to cause the formation of solid tumours within a short period of time after infection of the host. Oncogenes, and the oncoproteins they encode, are responsible for the tumorigenic potential of these retroviruses. Retroviral oncogenes are closely related to and are derived from cellular oncogenes, which encode proteins with mitogenic activity such as growth factors. The invention closely relates to monoclonal anti-oncoprotein antibodies, and the method used to purify them. The method of the invention may be used for obtaining purified oncoprotein ligands from aqueous solutions. It may be used in this way to detect proteins produced in tumour cells to diagnose cancers caused by retroviruses. It may also be used for the prognostication of cented development (and other growth states including neoplasia) using either urine or other body fluid obtained by non invasive methods, the antibodies being used to assay for oncoprotein. As the antibodies bind to epitopes of known amino acid sequence, the type of oncoprotein being expressed in the patient may be determined. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide #4049 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                Purifying oncoprotein ligands using monoclonal antibodies, useful for diagnosing cancers caused by retroviruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe; human; microarray; gene expression; cervical epithelial cell;

(SENP: see A110068-A120859). The present sequence is a peptide proceed by one such probe. The SENPs are derived from human HeLa cells. The SENPs are because the sea be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; foetal liver; gene expression; single exon nucleic acid probe

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 44 cells. The method involves contacting the probes with a collection of detectably labelled mucleic acids derived from mRNA of human breast, and then measuring the label bound to each probes of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional conformation from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed
such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; microarray; single exon probe; gene expression; breast; disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide #4074 encoded by breast cell single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New spatially-addressable set of single exon nucleic acid probes, for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 27; SEQ ID NO 14391; 327pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                       The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide #4170 encoded by probe for measuring placental gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  measuring human gene expression in a sample derived from human heart (see ABA21555-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, monitoring and proponsing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                  expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                       The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
          Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                      Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to novel single exon nucleic acid probes use AA100010-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory disease of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                                                                                                  Novel single exon nucleic acid probe used to measuring gene expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human peptide encoded by genome-derived single exon probe SEQ ID 29086

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes of the human lung, comprising the novel set of probes of the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, in the above mentioned microarray; assigning exons to a single gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The the above mainting exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or call types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or call types indicates that expression of the exons in the tissues and/or call types indicates that the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung cancer, chronic obstructive pulmonary disease such as asthma. Jung cancer, chronic obstructive pulmonary diseases (ODP), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, cuberous sclerosis, quanter a disease, Niemann-Pick disease, Hermansky-budlak syndrome, sarcoidosis, pulmonary hamenosiderosis, primary chistiocytosis, lymphangioleiomyomicosis, pulmonary alveolar proteinosis, dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, JAK, protein kinase signalling; protein tyrosine kinase; enzyme; kinase like domain; pseudo-substrate loop; anti-asthmatic; anti-allergic; dermatological; anti-inflammatory; anti-tumour; cytostatic; immunostimulant; JAK inhibitor; JAK modulator; asthma; eczema;
                                                                                                         Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the invention. Note: The sequence data for this patent did not of the printed specification, but was obtained in electronic for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
The present invention describes a method (M1) of selecting or designing a compound for the regulation of JAK activity involving assessing the ability of the compound to modulate the interaction of the pseudocation of the pseudocation of the pseudocation of the pseudocation of the pseudocation of the pseudocation of the pseudocation interactes with the kinade of the compound (C1) which reduces the KLD (interacts with the binding of the PSL with the KLD), which reduces the activity of the JAK compared to that of the JAK in the absence of the compound. JAK has anti-asthmatic, anti-callergic, dermatological, anti-inflammatory, immunostimulant, anti-tumour and cytostatic. The method can be used for designing or selecting a compound with the ability to regulate JAK activity; for the treatment of a subject suffering from a JAK-associated disease state such as asthma, cezema, food allergy, inflammatory bowel disease, Crohn's disease, Crohn's disease, Lumour and prostate cancer. The method provides a number of target points at which a chemical entity regulates JAK activity. The present sequence represents a JAK family related amino acid sequence, which is given in
                                                                                                                                                                                                                                                                                                                                                                                                                            Method of selecting or designing a compound useful in the treatment of e.g. asthma by assessing the ability of the compound to modulate the interaction of the pseudo-substrate loop with the kinase like domain.
food allergy; inflammatory bowel disease; Crohn's disease; leukaemia; lymphoma; cutaneous inflammation; immune suppression; solid tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 23; 82pp; English.

Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FES, GUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a partial protein which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tyrosine kinase; cancer; anti-cancer agent; signalling molecule; tumourigenesis; somatic alteration; colorectal cancer; NTRK3; FBS; GUCY2F; MCCK; MLK4; kinase domain; cytostatic; tyrosine kinase inhibitor; guanylate cyclase stimulator; chicken.

```
This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FES, GUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a partial protein which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tyrosine kinase; cancer; anti-cancer agent; signalling molecule;

This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FSE, gUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase

This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3 FES, GUCYSP and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimularors. The invention may be useful for developing methods for activity mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a partial protein which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    tyrosine kinase; cancer; anti-cancer agent; signalling molecule; tumourigenesis; somatic alteration; colorectal cancer; NTRK3; FES; GUCY2F; MCCK; MLK4; Kinase domain; cytostatic; tyrosine kinase inhibitor; guanylate cyclase stimulator; mouse; murine.
stimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a partial protein which was used in the exemplification of the invention.

```
The invention relates to a crystal (I) of human janus kinase 3 (JAK3)

domain, domain comprising JAK3 domain, a computer (composition comprising a machine-
readable data storage medium, working memory, CPU and output hardware),

using a computer for selecting an orientation of a chemical entity that
interacts favorably with a binding pocket/domain, using a computer for
selecting an orientation of a chemical entity with a favorable shape

complementarity in a binding pocket of JAK3, identifying a candidate
inhibitor of a molecule/molecular complex comprising a binding pocket of domain, designing a compound/complex that interacts with a binding

pocket/domain, utilizing molecular replacement to obtain structural
information of a molecule/a molecular complex of unknown structura (
information of a molecule/a molecular complex of unknown structural
information of a molecule/a molecular complex of unknown structural
information of a candidate inhibitor that interacts with a binding site of information and a chemical entity chosen from adenosine, ATP, ATP

che molecule is sufficiently homologous to human JAK3 domain); and
identifying a candidate inhibitor that interacts with a binding site of a
chuman JAK3 domain and a chemical entity chosen from adenosine, ATP, ATP

chosphate and active site inhibitor (preferably AMP-PNP). The JAK3 domain
is chosen from amino acid residues 810-1100, 810-1104, 810-1115, 810-1124

for screening kinase inhibitor useful as drugs for treating severe
combined immunodeficiency (SCID). The present sequence is the alpha-FG

region from another tyrosine kinase used as comparator for the alpha-FG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of human janus kinase 3 domain, domain complex or its homolog,
